

iOS Domain Task

Overview

This task is designed to evaluate your ability to build a real-world iOS application using SwiftUI. There are no step-by-step implementation instructions. You are expected to make architectural decisions, design the UI thoughtfully, and ensure a smooth user experience.

What we are assessing is not just whether the app runs. We are assessing whether you understand how to structure SwiftUI code, manage state effectively, and communicate your design decisions clearly.

Read this document in full before you begin. Every detail here is deliberate.

TASK-1

Part 1: Build a Simple Counter Dashboard

Create an iOS app using SwiftUI with the following elements:

- A number display (starting from 0)
- Two buttons: Increment and Reset
- A text field to enter a custom step value (optional)

Functionality:

- Increment button increases the number
- Reset button sets it back to 0
- If a step value is entered, increment should follow that value

Part 2: Add State-Based Behaviour

- Change the colour of the number based on its value:
 1. Low (0–10): Green
 2. Medium (11–20): Orange
 3. High (>20): Red
- Disable the increment button after a certain limit (e.g., 50)
- Display a message when the limit is reached

Part 3: Activity History List

- Track user actions (e.g., increment, reset)
- Show them in a scrollable list
- Allow deletion of items
- Persist data locally so it remains after app restart

Part 4: Navigation and Details Screen

Navigate to a detail screen when a history item is tapped. Display:

4. Action performed
5. Timestamp

Use proper navigation and data passing between screens.

Deliverable

A fully functional iOS app built in SwiftUI that satisfies all four parts above. The app must run on iOS 16 or later and be free of build errors.

BONUS — TASK-2

Build a "Daily Habit Tracker" feature inside the same app:

- Allow users to create simple habits (e.g., Drink Water, Exercise)
- Mark habits as completed for the day
- Show completion status (done / not done)
- Persist data locally
- Display a summary like: "3 out of 5 habits completed"

You are free to design the UI and structure.

What We Look For

- Demonstrates understanding of SwiftUI state management, layout, and navigation. Design choices reflect genuine thought about user experience.
- Handles data persistence, list operations, and screen transitions correctly. Decisions are implemented cleanly, not just hacked together.
- Code is readable, logically structured, and follows Swift conventions.
- Bonus feature is implemented thoughtfully and integrates naturally with the core app.

A Note from IOS Domain

We are not looking for perfect UIs or zero bugs. We are looking for people who think clearly about structure, handle edge cases deliberately, and write code that someone else can read and understand.

We look forward to seeing your submission.

Submission Guidelines

1. Share a GitHub repository link or a Google Drive link with the full project.
2. Include a README with:
 3. Features implemented
 4. Steps to run the app
5. Ensure the link is accessible for review.
6. Deadline: As communicated on the recruitment portal. Late submissions will not be reviewed.

**Wishing You All the Best
iOS Domain ADG**
